

License Plate Scanner

David Lei, Luis Luis Gabriel Ortiz-Anguiano, and Ryan Kurian George

Dataset

We haven't decided on what dataset to use yet but so far, we have found [this dataset](#). It contains 10,125 high-quality images of license plates we can use to train our model to recognize license plates.

Task

Our task is to build and train a deep learning model to recognize license plates. It should be able to obtain various data from the license plates as well, such as the license plate number and the US state the license plate belongs to.

In order to recognize license plates, we will also need computer vision. This way, we have a way of looking at real license plates.

Dividing the Work

In order to divide the work between team members, each one of us will be assigned a specific part of the project. For example, one might focus on computer vision, the other two might focus on the hyperparameters. Of course, this won't be each team member's main focus, as sometimes, unexpected events might happen, which requires us to perform other team members' duties.

Frameworks

We don't have a solid foundation yet, but we are thinking of using PyTorch for deep learning, just like we did in class. There are some useful concepts that were covered on the slides that may come in handy with our project.

For computer vision, we are thinking about using OpenCV, as it's something that some of us have experience in during a hackathon, especially when it comes to recognition of words.
